Show Explanations

1 A logistics company's chief operating officer asks an architecture team to build a Claude assistant for 600 dispatchers. The stated goal is to "make dispatch more efficient," but no target workflow, baseline performance, or acceptable error rate has been defined. The sponsor wants the team to select a model and demonstrate a prototype in two weeks. What should the architect do FIRST?

A. Select a low-latency model and prototype the most common dispatcher conversation.

B. Map the target workflow, error consequences, baseline metrics, and measurable business outcome. **Correct**

C. Interview dispatchers to collect preferred response formats and interface customization requests.

D. Estimate token consumption and infrastructure costs for several projected adoption levels.

2 A hospital plans to use Claude to summarize protected health information and recommend which denied insurance claims should be appealed. The system will process 8,000 claims daily, and appeals must be submitted within 24 hours. Compliance says consequential decisions require accountability, but stakeholders disagree about whether Claude will advise specialists or submit appeals automatically. Which unresolved requirement

should the architect clarify FIRST?

A. Whether the hospital prefers hourly batches or a continuously running processing queue.

B. Whether summaries should use concise prose or a standardized section-based template.

C. Who has decision authority and which cases require review before an appeal is submitted.
Correct

D. Which model provides the lowest measured latency for the average claim document.

3 A manufacturer is transferring an internal Claude operations agent to a central support team. The agent can restart services and modify scheduling records. A current-state diagram lists components, but it does not explain why permissions were granted, who owns tool failures, or how to reverse a faulty release. The original developers will leave the project next month. Which documentation improvement is MOST important before handoff?

A. Add screenshots showing the agent's most common successful conversations and tool responses.

B. Create a detailed catalog of prompt wording alternatives tested during the initial prototype.

C. Record trust boundaries, permission rationale, interface owners, failure escalation, release decisions, and rollback procedures. **Correct**

D. Expand the component diagram to include model token limits and average response lengths.

4 A retailer's Claude-based code-modernization platform passes security scans and integration tests. In a pilot, six development teams apply different review practices, and some merge generated changes without testing. No team owns prompt standards or incidents caused by generated code. The CIO wants to onboard 80 teams next quarter. Which action BEST addresses the production-transition risk?

A. Increase automated code generation coverage so teams receive more consistent modernization output.

B. Assign operational ownership and establish shared review, testing, release, rollback, and onboarding standards. **Correct**

C. Allow each team to define independent practices because application owners understand their repositories best.

D. Add a more capable model to reduce the likelihood that developers need to revise generated changes.

5 A bank evaluates a versioned model-and-prompt update for its employee knowledge assistant. Overall grounded-answer quality rises from 89% to 92%, median latency falls by 12%, and cost is unchanged. However, quality on low-volume anti-money-laundering policy questions falls from 97% to 86%; the approved release threshold for that segment is 95%. Which release decision is BEST?

A. Deploy globally because aggregate quality and latency both improved without increasing operating cost.

B. Deploy only to compliance users so specialists can identify errors in the affected policy segment.

C. Hold the release, remediate the critical-segment regression, rerun versioned evaluations, and retain rollback capability. **Correct**

D. Lower the anti-money-laundering threshold because those questions represent a small percentage of total traffic.

6 A regional energy provider asks an architect to build an autonomous Claude agent that can resolve billing disputes and issue account credits. Incorrect commitments may create regulatory and financial exposure. The sponsor wants a prototype in four weeks, but has not defined transaction limits, review requirements, expected volumes, or acceptable error rates. What should the architect do FIRST?

A. Prototype the agent with read-only billing access and defer credit issuance until a later phase.

B. Map the workflow, decision authority, error consequences, constraints, and measurable success criteria with stakeholders. **Correct**

C. Select a Claude model using a benchmark of representative billing questions and target response latency.

D. Implement human approval for every credit so the prototype can proceed without further risk discovery.

7 A healthcare network is evaluating Claude for 18,000 prior-authorization cases per month. The system will process protected health information and must return results within five minutes. Stakeholders have proposed a 95% agreement target against historical decisions, but have not decided whether Claude will draft a recommendation or issue the authorization outcome. Which unresolved requirement should the architect prioritize?

A. Whether historical cases can be partitioned into enough specialty-specific evaluation sets.

B. Whether retrieval latency can remain within the target during monthly demand peaks.

C. Whether a more capable model improves agreement enough to justify its operating cost.

D. Who has legal decision authority and which outcomes require review, escalation, and audit. **Correct**

8 An insurer wants Claude to reduce manual work for 70,000 claims received

daily. Errors in bank account and payment amount fields are substantially more costly than errors in descriptive notes. The business goal is to reduce processing labor by 35% without increasing incorrect payments. Which requirement set BEST translates that goal into architecture criteria?

A. Set field-level quality thresholds, maximum review rate, daily throughput, and cost per successfully processed claim. **Correct**

B. Set aggregate extraction accuracy, average input-token usage, monthly uptime, and total model spending.

C. Set user satisfaction, average response length, prompt consistency, and the percentage of claims processed automatically.

D. Set model benchmark scores, peak request rate, retrieval precision, and average cost per API invocation.

9 A manufacturer plans a global Claude operations assistant used around the clock. It answers procedure questions from approved manuals and submits maintenance work orders through an enterprise API. During API outages, technicians still need read-only guidance, but new work orders may be deferred. Executives describe the requirement only as “highly available.” Which requirement package should the architect recommend?

A. Require the most capable model in two regions and apply one availability target to every assistant function.

B. Require retries for all failed tool calls and retain requests until the maintenance API becomes available.

C. Define capability-specific availability, safe degraded behavior, recovery targets, escalation paths, and service owners. **Correct**

D. Define an end-to-end uptime target and use a manual help desk whenever any dependency is unavailable.

10 A finance company reviews 400,000 lending documents monthly.

Evaluation shows full automation would reduce turnaround by 40% and annual labor cost by $2 million, but would allow approximately 30 additional material errors per month in high-value contracts. A targeted-review design retains most savings and reduces the estimate to two additional errors. Executives ask the architect which option to approve. What is the BEST response?

A. Recommend full automation because the aggregate accuracy and cost reduction provide the strongest measurable business case.

B. Present quantified benefits and residual risk by contract tier, recommend targeted review, and identify the authorized risk owner. **Correct**

C. Recommend review of every output until the system completes a year in production without a material incident.

D. Present both designs without a recommendation because financial risk acceptance is solely an executive responsibility.
